Games That Feel You

Emotion-Aware Storytelling

SCREEN DESIGN CONCEPTS

Design + Story Contribution

This document presents four proposed interface designs for the project: the Main Game, Emotion Monitor, Consent and Post-Game Debrief screens. The images are AI-generated illustrations created to communicate possible layouts and interactions; they are proposed designs, not screenshots of a finished or implemented game.

AI-use transparency

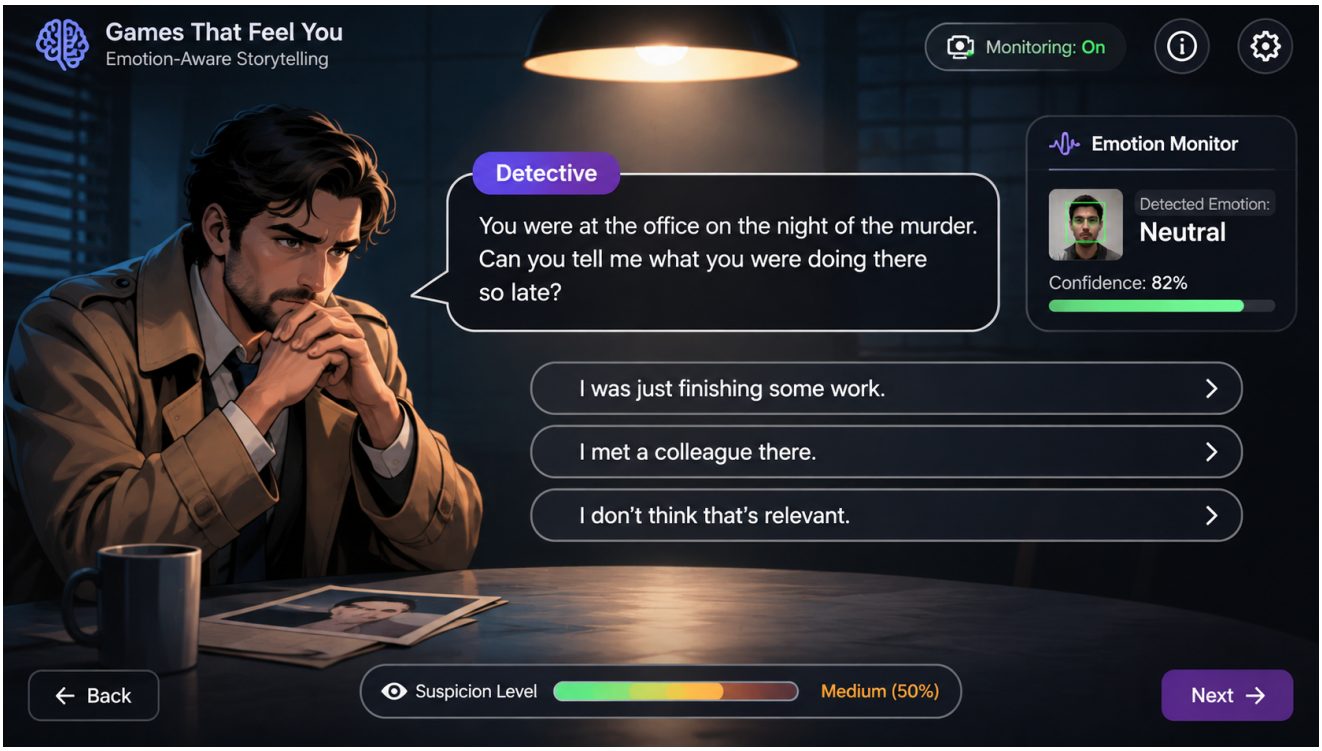

AI assistance was used to generate the visual illustrations in this document. They are conceptual mockups and may include placeholder text, values or interface elements. The project team should review and adapt them to match the final design and actual implementation.

Important implementation checks

- Show the emotion estimate only in the transparent-monitoring condition.
- Make the option to play without monitoring clear and usable.
- Treat emotion labels and confidence values as system estimates, not facts about the player.
- Confirm webcam processing, retention and sharing statements with the coding team before participant testing.

Screen 1 — Main Game

The player reads the detective’s question and selects a response. This mockup illustrates the dialogue area, response choices and story feedback. The emotion panel should only be visible in the transparent-monitoring condition; it should be hidden in the hidden-monitoring and button-only conditions.

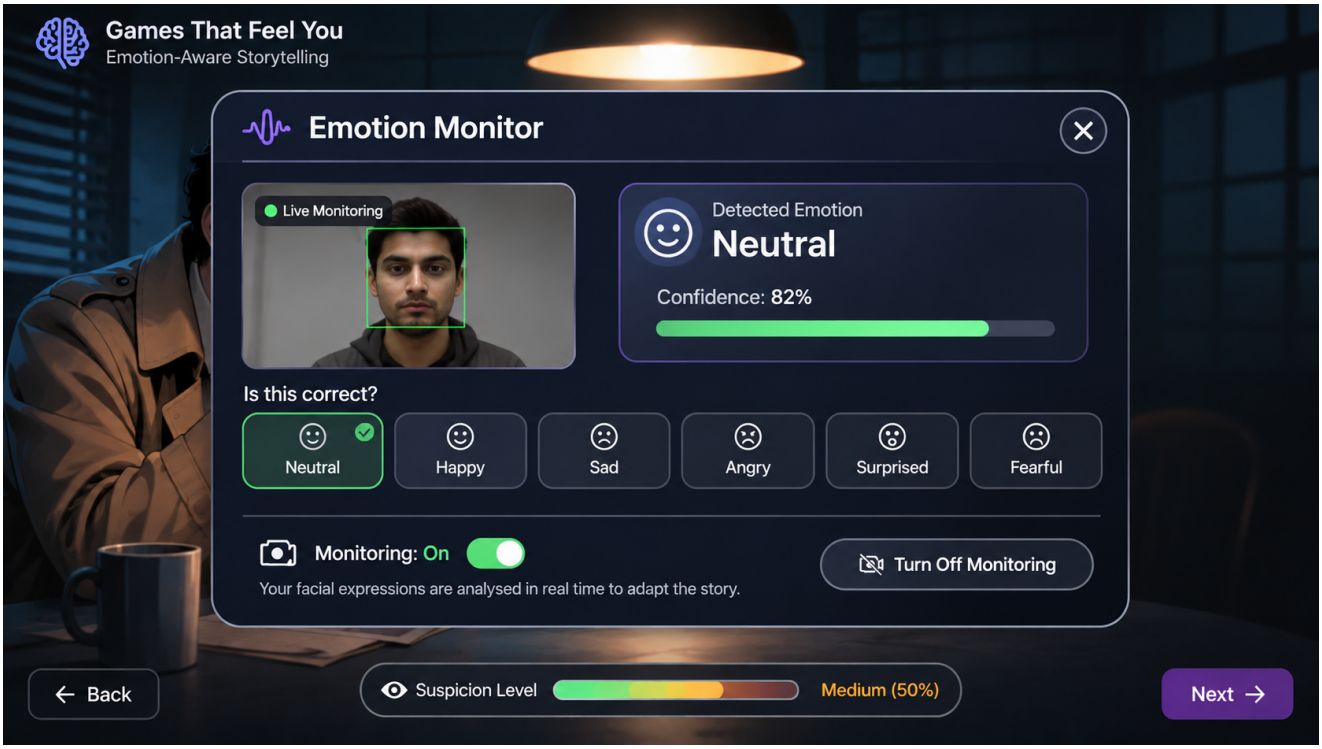

Screen_1_Main_Game.png

AI-generated proposed illustration — not a screenshot of the implemented game.

Screen 2 — Emotion Monitor

The player can see the system’s current emotion estimate, correct it, or turn monitoring off. The estimate and confidence value shown are illustrative placeholders, not validated recognition results.

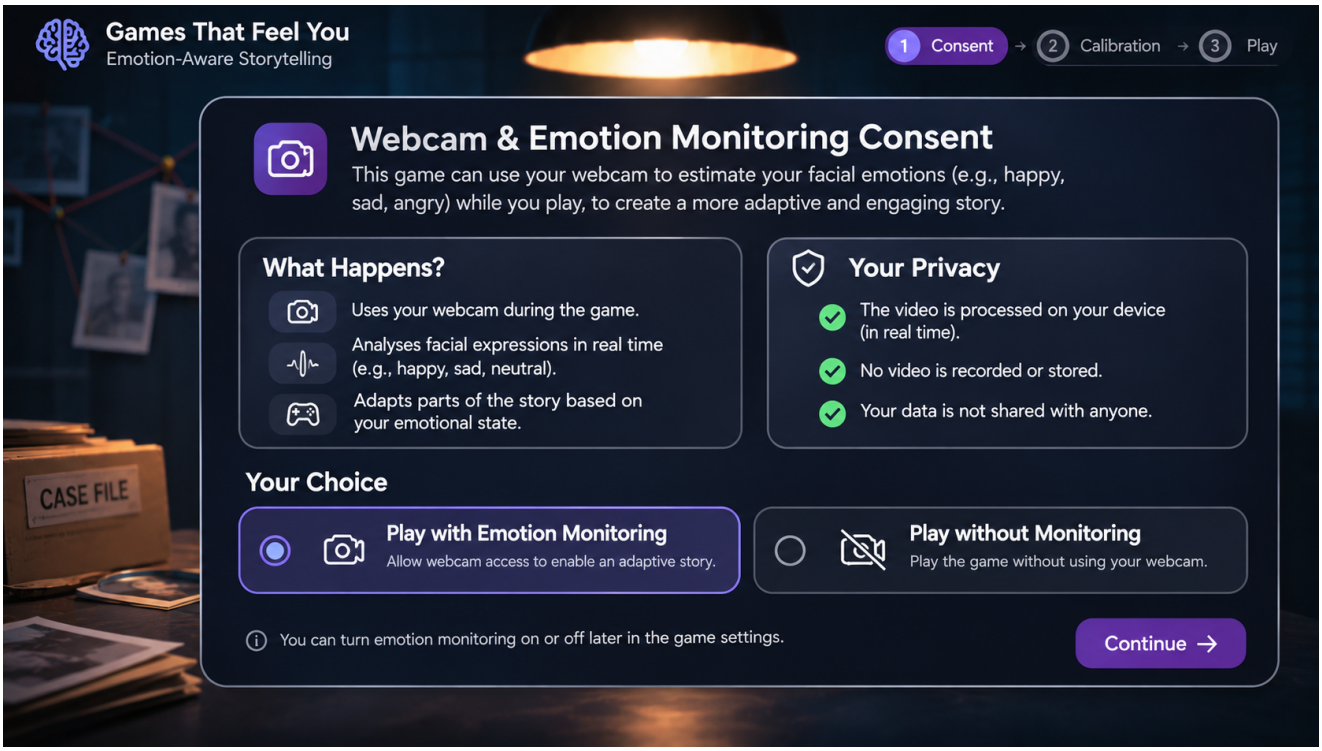

Screen_2_Emotion_Monitor.png

AI-generated proposed illustration — not a screenshot of the implemented game.

Screen 3 — Consent

This screen explains the proposed webcam-based feature and offers a clear choice to play with or without monitoring. Confirm statements about on-device processing, storage and sharing with the implementation team before using this as final participant-facing consent text.

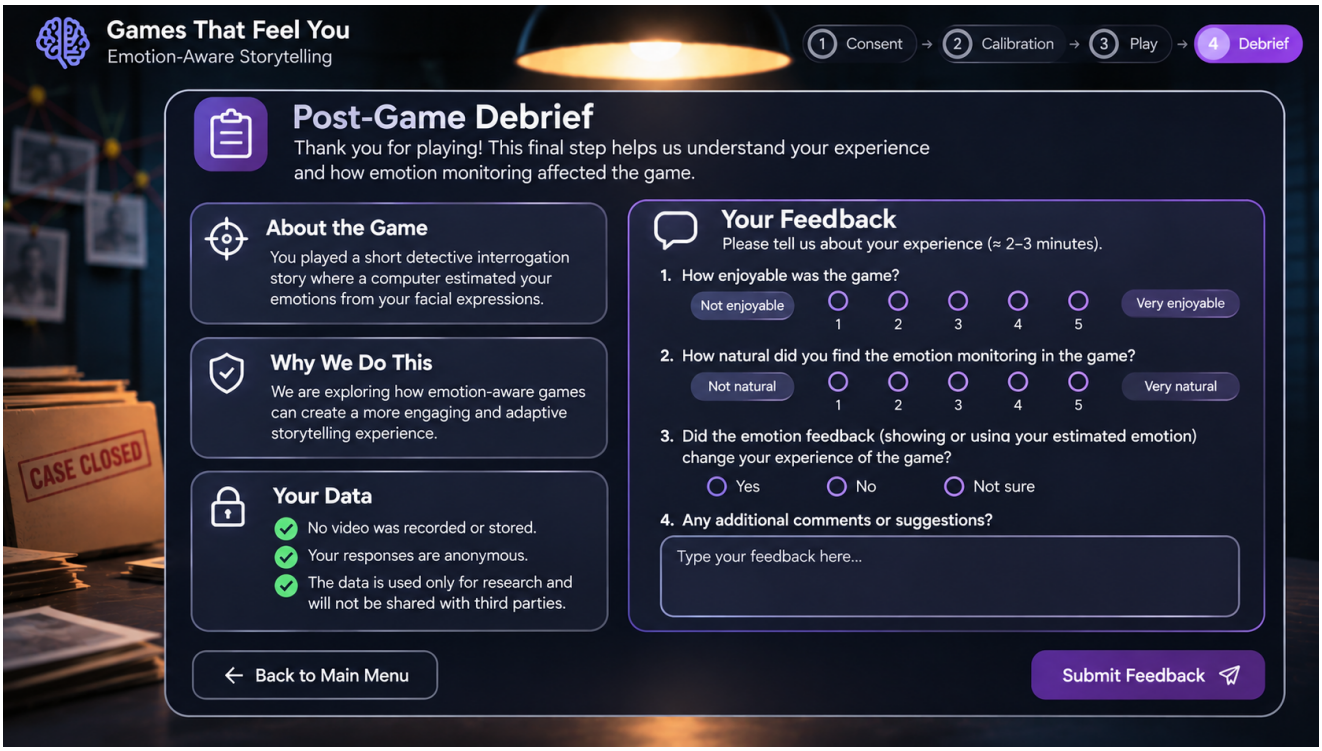

Screen_3_Consent.png

AI-generated proposed illustration — not a screenshot of the implemented game.

Screen 4 — Debrief

The debrief explains the study and invites feedback about enjoyment and the monitoring experience. Coordinate the questions with the research/evaluation team, and verify all data-handling statements against the actual implementation.

Screen_4_Debrief.png

AI-generated proposed illustration — not a screenshot of the implemented game.
